## 1 Download Twitter Data for Sentiment Analysis

We use a dataset that contains 1.6 million training and 350 test tweets from 2009 with algorithmically assigned binary positive and negative sentiment scores that are fairly evenly split.

```
[9]: from pathlib import Path import requests from io import BytesIO from zipfile import ZipFile
```

## 1.1 Download and unzip

Download the data from here.

The following code downloads and extracts the content of the compressed file and stores it in 'sentiment140', while renaming the content as foltraining.1600000.processed.noemoticon.csv lows: train.csv, and to testdata.manual.2009.06.14.csv to test.csv

```
[2]: path = Path('sentiment140')
if not path.exists():
    path.mkdir()
```

```
[3]: URL = 'http://cs.stanford.edu/people/alecmgo/trainingandtestdata.zip'
```

```
[5]: response = requests.get(URL).content
```
